If a business is in the 34% tax bracket, taxes are reduced by 34 cents for every dollar of interest expense. A 10% interest rate thus becomes  $(10\% \times (1 - .34))$  or 6.6% after taxes. This causes the after-tax component of debt in the cost of capital to be less than the required return of the firm's creditors.

#### Financial Management (Chapter 14: The Cost of Capital)

The firm's MCC is the additional cost the firm will pay to raise an additional dollar of capital, assuming the capital is raised using the optimal capital proportions (see chapter on capital structure). The relationship between MC and AC can be represented graphically, as indicated in the figure below.
